# 1. Overview

A standard Odoo database shows every user the full menu of every app they have access to. In a busy company that means long menus full of entries people never use, accidental clicks into screens they should not touch, and new users who struggle to find the few menus that matter to them.

**Hide Any Menu User & Group Wise** lets administrators decide exactly which menus each user, or each group of users, can see. Version 20.0.2.0.0 goes further: administrators can set the order of the apps for a whole team, every user can arrange their own apps, and anyone can star the menus they use most and reach them from the navbar in one click.

Everything works on top of standard Odoo menus. Nothing is deleted or copied: removing a restriction, a profile or a favourite simply brings the standard behaviour back.

### Who it is for

- Administrators who want each user or team to see only the menus relevant to their job.
- Teams that want their most-used apps first and a short list of shared shortcuts.
- Users who want to reach the screens they use every day without digging through menus.

# 2. Features at a Glance

The module adds the following capabilities to Odoo 20 Community and Enterprise. Each one is explained in the chapters that follow.

| Area | Features |
|---|---|
| **Menu hiding** | • Hide any menu or sub-menu for a specific user<br>• Restrict a menu for a whole user group<br>• Apply a menu's restrictions to all of its sub-menus in one click<br>• System administrators are never restricted |
| **Central control** | • One screen listing every restricted menu with its users and groups<br>• Copy one user's hidden menus onto other users with a wizard |
| **Menu Profiles (new)** | • Default app order for a group of users or for chosen users<br>• Team shortcuts shown in every member's favourites<br>• Priority decides which profile applies when several match |
| **Arrange My Apps (new)** | • Each user drags apps into a personal order from the user menu<br>• One click returns to the team order |
| **Favourite Menus (new)** | • Star icon in the navbar with the user's favourite menus<br>• Star the current page, or search any menu and star it<br>• Hidden menus never appear in favourites or search |

# 3. Installation and Setup

## Requirements

- Odoo 20 Community or Enterprise Edition.
- No extra Python packages. The module depends only on the standard *web* module.

### Workflow

1. Copy the *hide_menu_user* folder into a directory listed in your Odoo *addons_path*.
2. Restart the Odoo service.
3. Activate developer mode, open **Apps** > **Update Apps List** and confirm.
4. Search for **Hide Any Menu** and click **Activate**.
5. Refresh the browser. A **Menu Management** menu appears under **Settings** > **Users & Companies**, and every user gets the favourites star and the **Arrange My Apps** entry.

## Upgrading from 20.0.1.0.0

Upgrade the module from the Apps menu as usual. All existing hidden menus and group restrictions are kept unchanged; the new features start empty, so nothing changes for users until you create a menu profile or they star a menu.

## Access rights

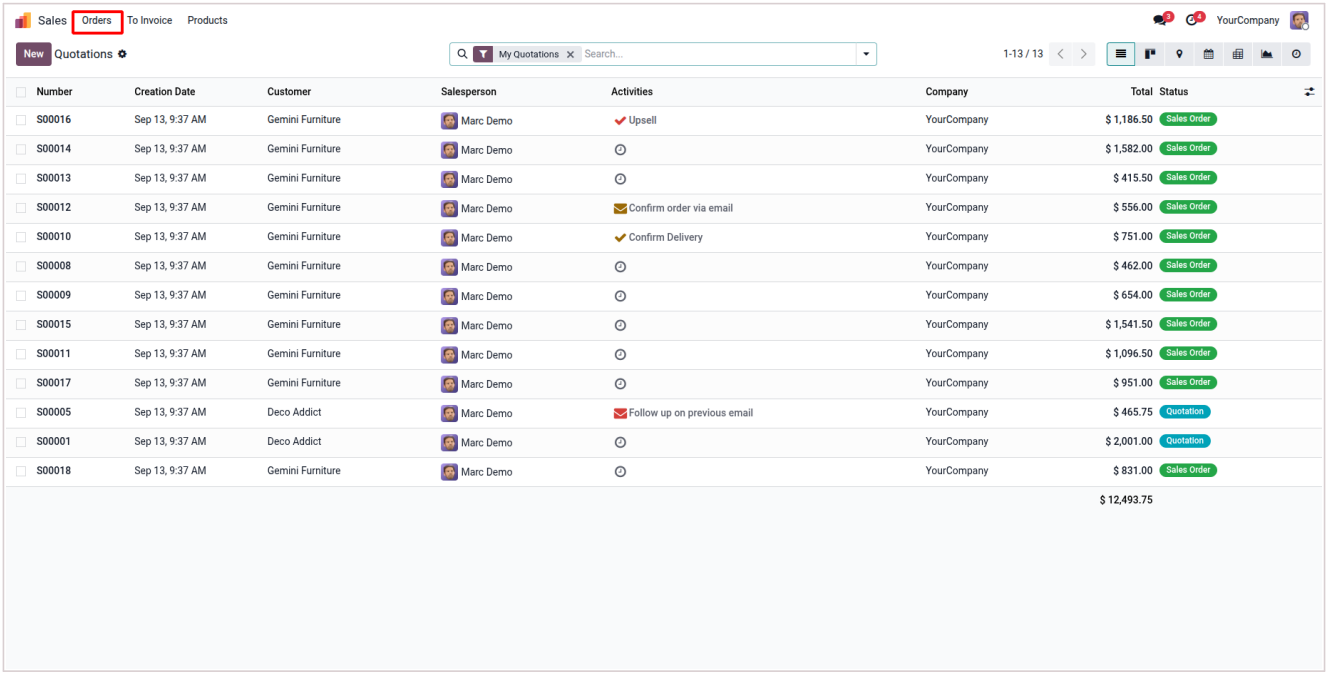

| Who | What they can do |
|---|---|
| **Administrator (Settings)** | Manage hidden menus, menu restrictions, menu profiles and the copy wizard. Never restricted by hidden menus. |
| **Internal user** | Star and unstar their own favourite menus and set their own app order. They cannot see or change other users' favourites. |
| **Portal / public user** | Not affected. The hide-menu settings only apply to internal users. |

# 4. Hiding Menus for a User

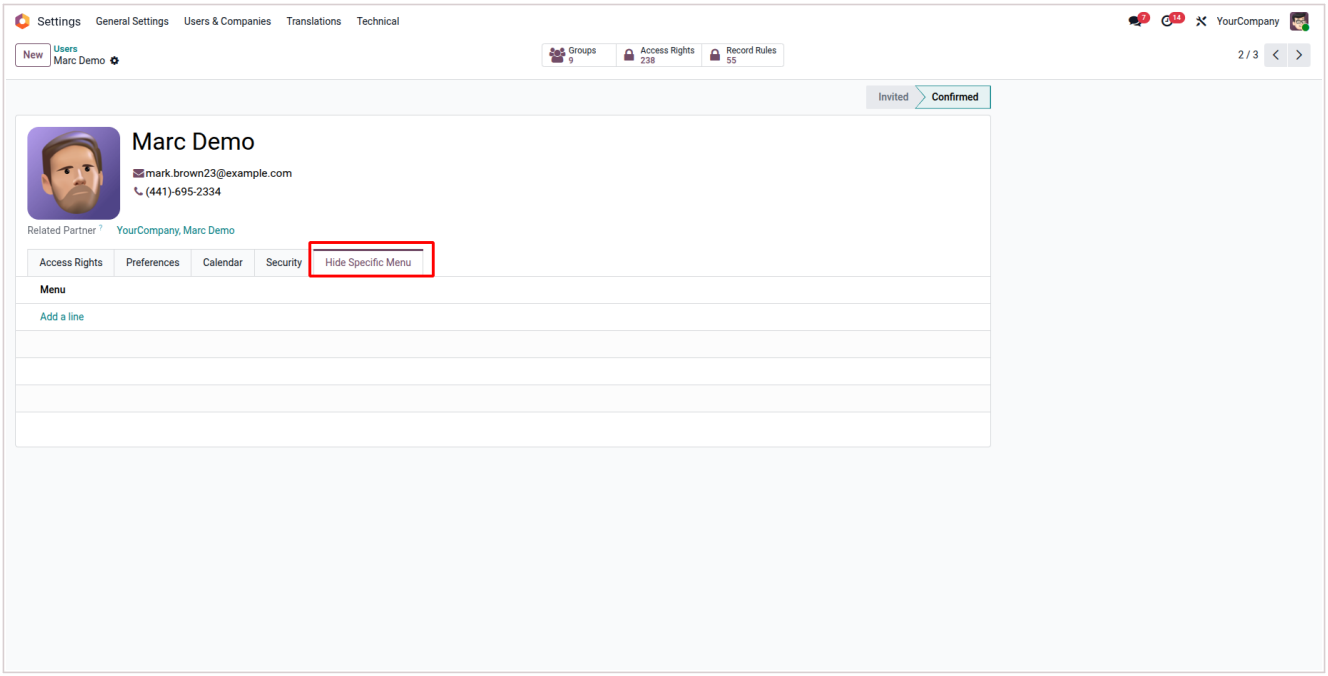

Hide any app, menu or sub-menu for one user from the user's form. The hidden menus disappear from that user's navbar and app list on their next page load.

## Workflow

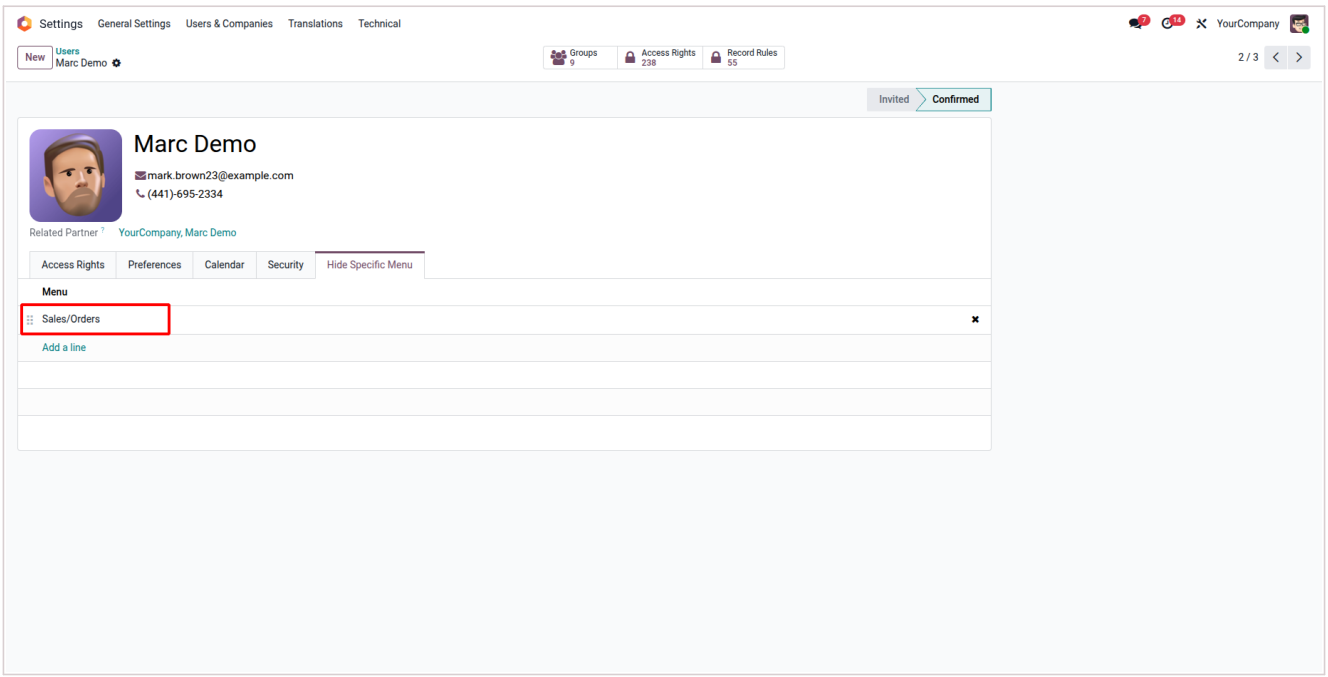

1. Go to **Settings** > **Users & Companies** > **Users** and open the user.
2. Open the **Hide Specific Menu** tab.
3. Click **Add a line** and select the menus to hide, then save.

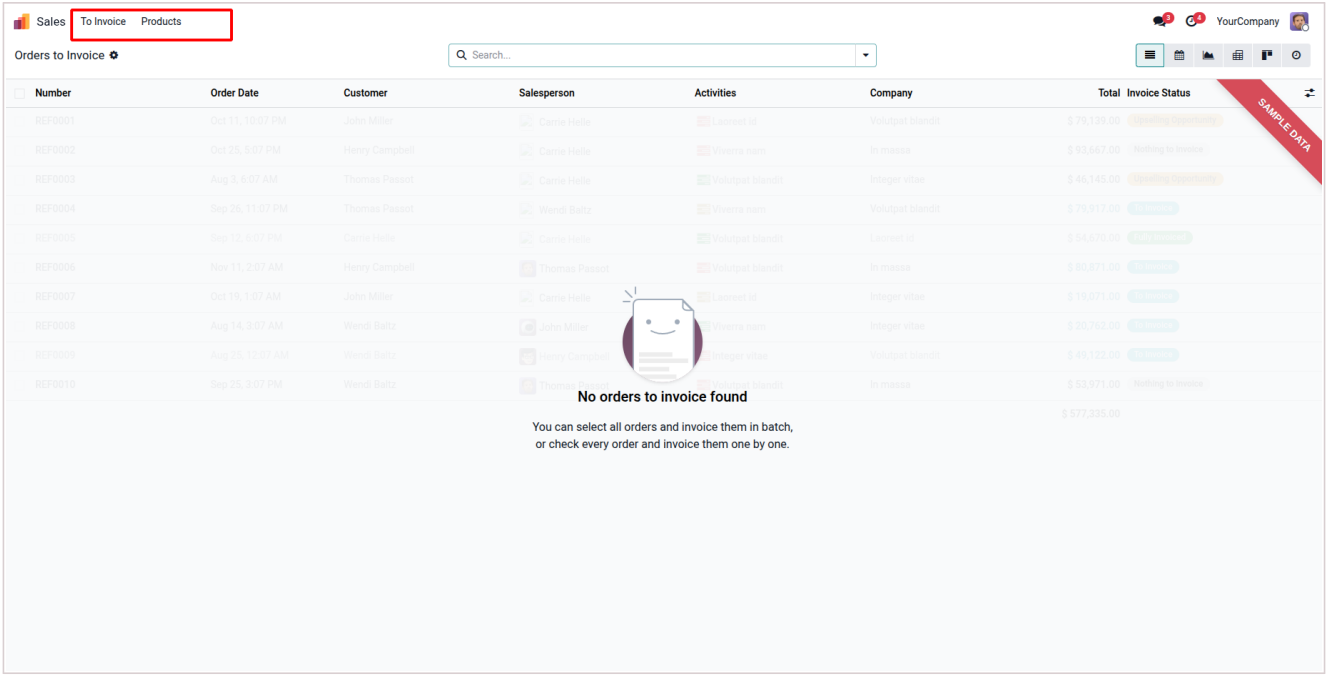

*Before: the user can see Sales > Orders*

*The Hide Specific Menu tab on the user form*

*Sales / Orders added to the hidden menus*

*After: Orders is no longer in the user's Sales menu*

**Note**

The tab is not shown for administrators or for portal users. Administrators always keep the full menu, and portal users have no backend menus to hide.

# 5. Restricting a Menu by User or Group

You can also work from the menu side: open a menu item and list the users and groups that must not see it. Every member of a restricted group loses the menu at once, including users added to the group later.

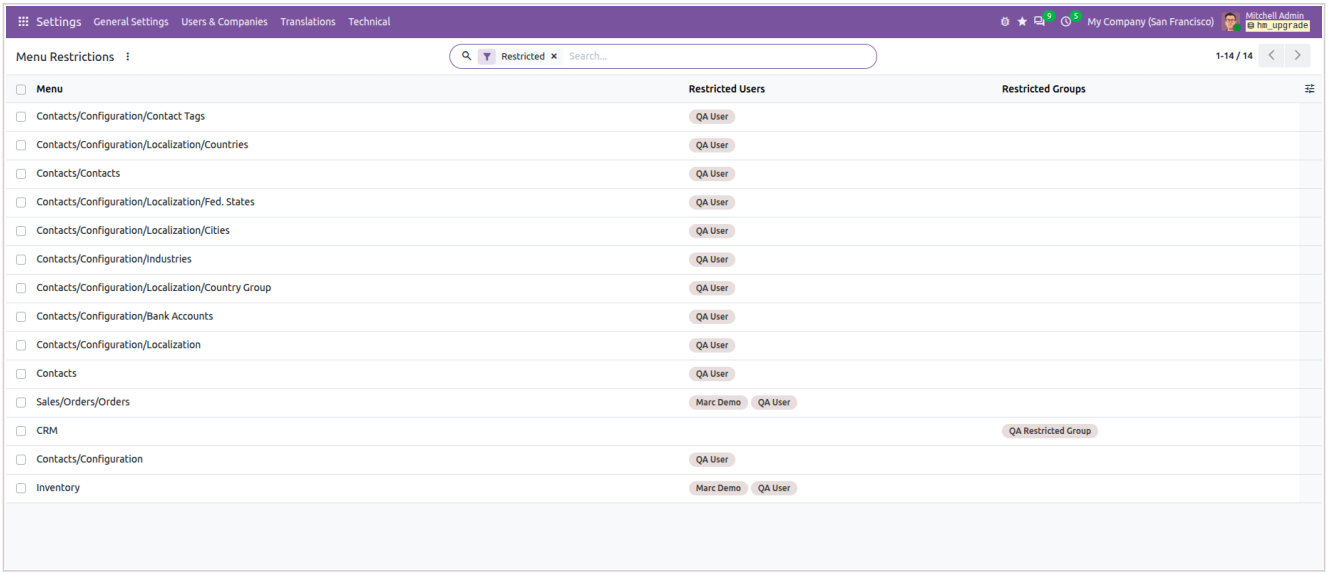

### Workflow

1. Activate developer mode and go to **Settings** > **Technical** > **User Interface** > **Menu Items**.
2. Open the menu and go to the **Restrict Access** tab.
3. Fill in **Restricted Users** and/or **Restricted Groups** and save.
4. To restrict everything under this menu too, click **Apply to sub-menus** and confirm. The same users and groups are added to every sub-menu.

> **Tip**
> Hidden menus on the user form and Restricted Users on the menu are the same setting seen from two sides, so a change in one place shows up in the other.

## 5.1 Central Menu Restrictions

**Settings** > **Users & Companies** > **Menu Management** > **Menu Restrictions** lists every restricted menu with its restricted users and groups. The list is editable, so you can add or remove users and groups directly, filter on *Restricted* and group by parent menu.

*Menu Restrictions: every restricted menu in one place*

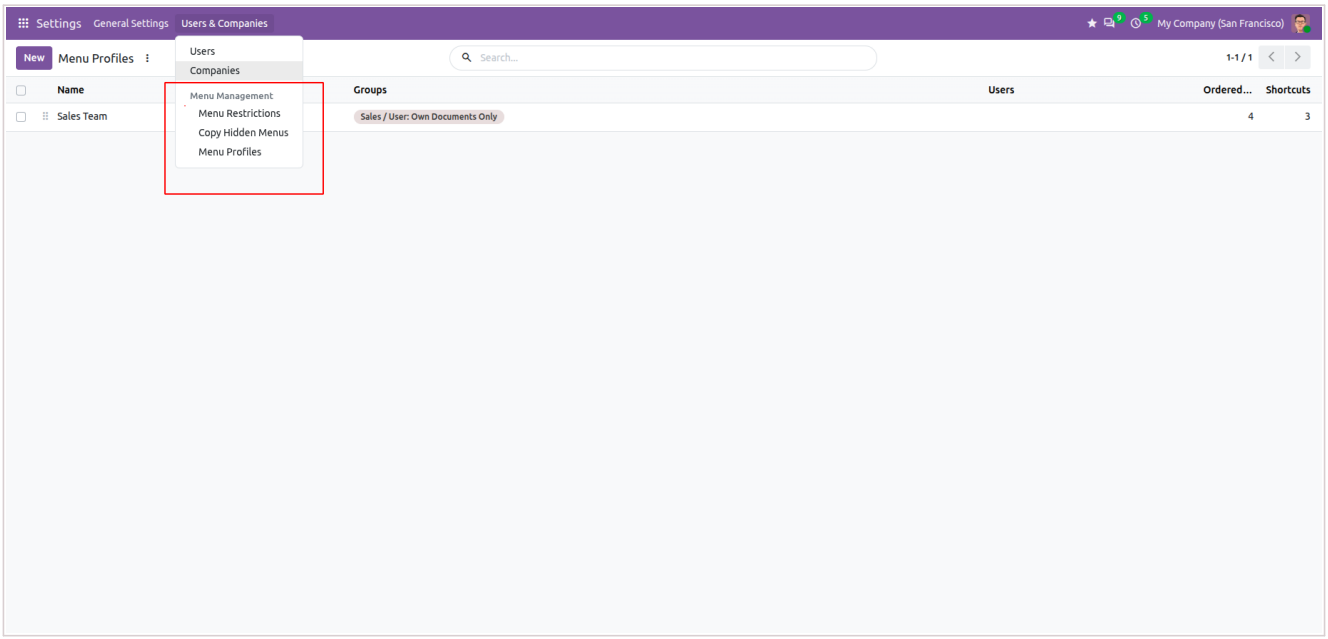

## 5.2 Copying hidden menus to other users

### Workflow

1. Open **Menu Management** > **Copy Hidden Menus**, or click **Copy these to other users** on a user's Hide Specific Menu tab.
2. Choose the user to **Copy From** and the users to **Apply To**.
3. Click **Copy**. The source user's hidden menus are added to each target user; menus the targets already had hidden are kept.

# 6. Menu Profiles

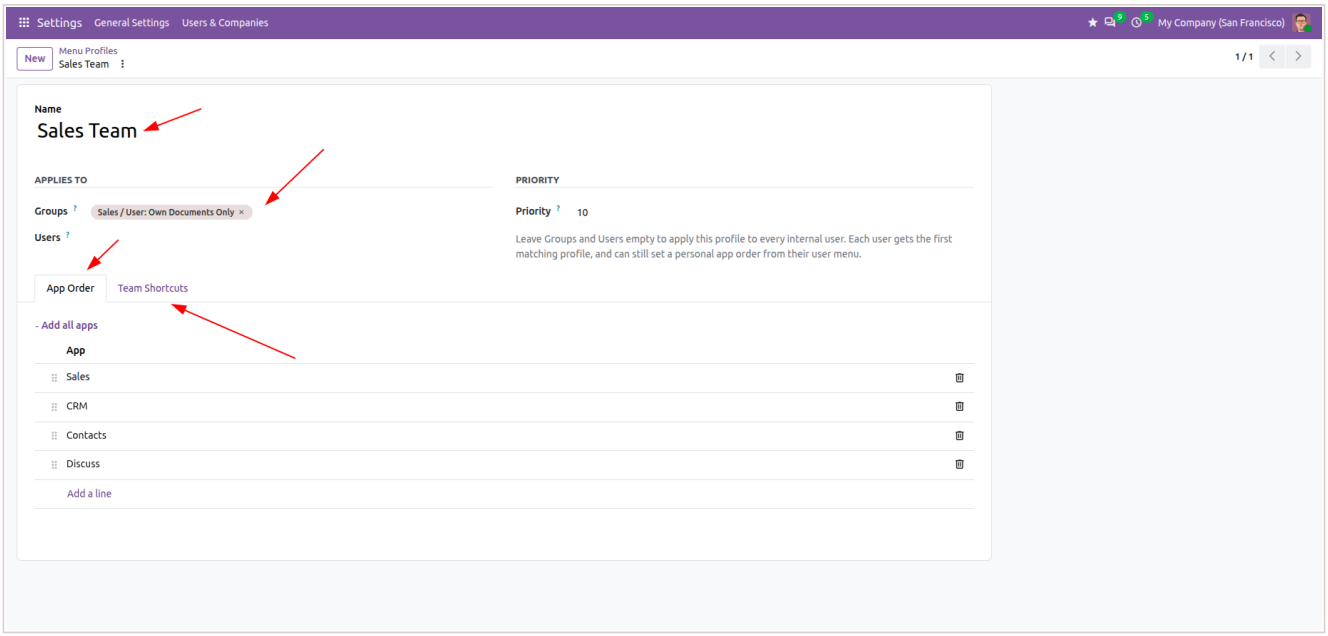

A menu profile gives a team its own app order and a short list of shared shortcuts. Profiles are matched by group or by user, so new team members get the right layout automatically.

*Menu Management > Menu Profiles*

## Workflow

1. Go to **Settings** > **Users & Companies** > **Menu Management** > **Menu Profiles** and click **New**.
2. Enter a **Name** and choose the **Groups** and/or **Users** it applies to.
3. In the **App Order** tab, click **Add all apps** and drag the apps into the order you want.
4. In the **Team Shortcuts** tab, add the menus every member should find in their favourites.
5. Save. Members see the new order after their next page load.

*A profile with its groups, app order and team shortcuts*

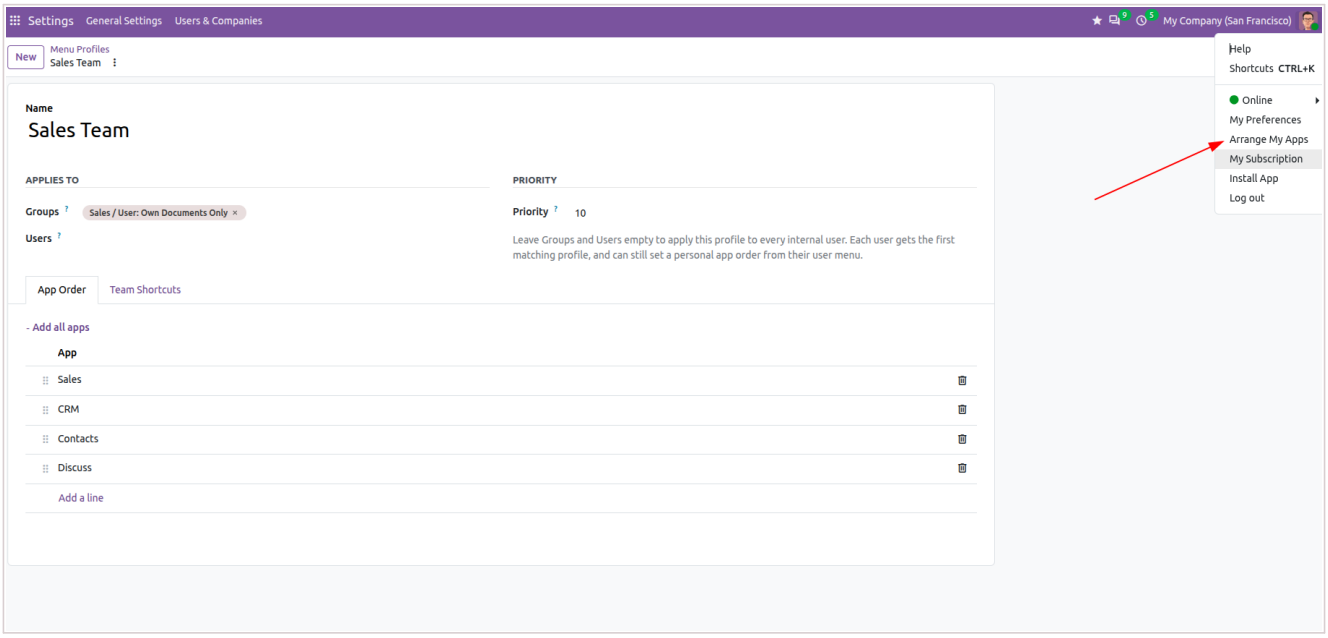

| Field | Meaning |
| --- | --- |
| **Name** | A label for the profile, for example "Sales Team". |
| **Groups / Users** | Who the profile applies to. Leave both empty to apply it to every internal user. |
| **Priority** | When a user matches several profiles, the one with the lowest priority number applies. |
| **App Order** | Apps listed here come first, in this order. Apps not listed keep their standard order after them. |
| **Team Shortcuts** | Menus pinned in the favourites of every member. Each user only sees the shortcuts they are allowed to open. |

# 7. Arrange My Apps

Every user can set a personal app order that overrides the team order from their profile.

### Workflow

1. Click your avatar in the top-right corner and choose **Arrange My Apps**.
2. Drag the apps into place, or use the up and down arrows.
3. Click **Save**. The apps menu, and the home screen on Enterprise, follow the new order.
4. To go back to the profile order, open the dialog again and click **Use Team Order**.

*Arrange My Apps in the user menu*

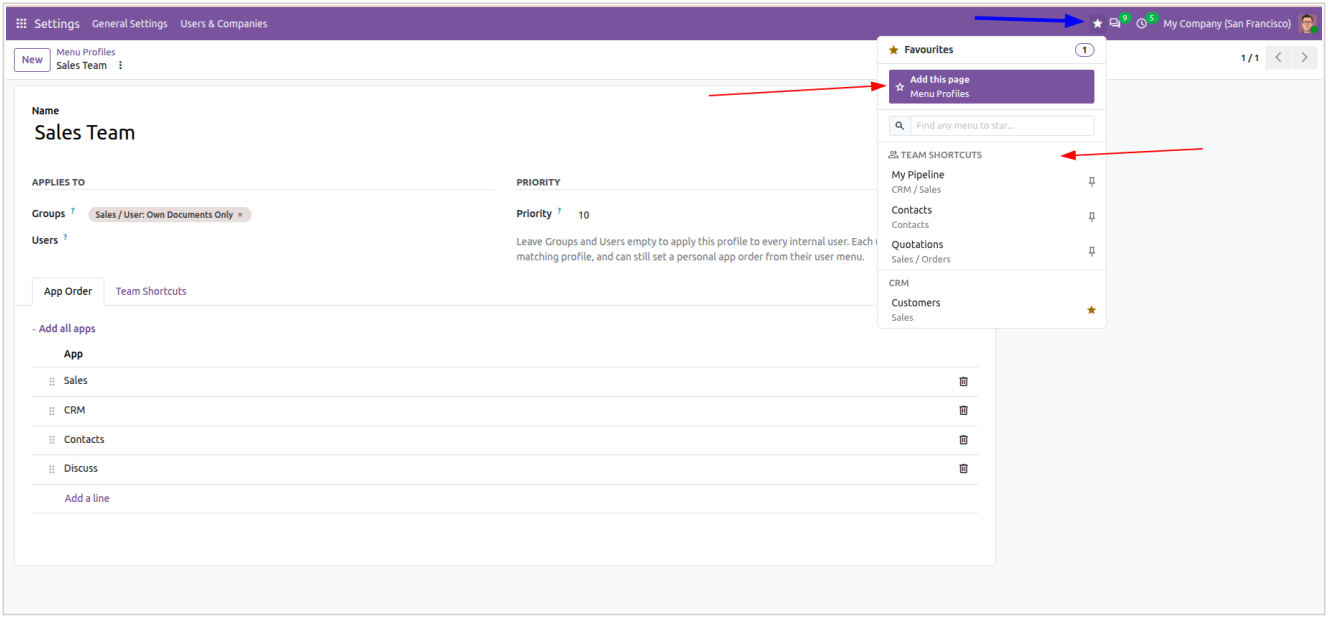

> **Note**
> Apps installed later are added at the end of a personal order. On Enterprise, saving a personal order also replaces any order set by dragging icons on the home screen, so one order applies everywhere.

# 8. Favourite Menus

The star icon in the navbar opens the favourites menu. It shows the team shortcuts from the user's profile and the menus the user starred, grouped by app.

### Workflow

1. Open any screen and click the star icon in the navbar.
2. Click **Add this page** to star the screen you are on. Click it again (**Remove this page**) to unstar it.
3. To star another menu, type in **Find any menu to star** and click the star next to the result.
4. Click a favourite to open it. Team shortcuts carry a pin icon and are managed by the administrator.

*The favourites menu with team shortcuts and a starred menu*

> **Note**
> Favourites are personal: users only see and change their own. Menus hidden from a user never appear in their favourites, team shortcuts or search results.

# 9. Notes and FAQ

### Does hiding a menu block access to the data?

No. Hiding removes the menu from the navigation only. To stop a user reading or changing records, use Odoo access rights and record rules as well.

### Why do I still see all menus as an administrator?

Users with the Settings (Administration) right are never restricted, so an administrator cannot lock themselves out of the configuration.

### A user does not see a change yet. What should they do?

Menus are loaded when the page opens. Ask the user to refresh the browser.

### Which order applies if a user has a personal order and a profile?

The personal order wins. Use Team Order in the Arrange My Apps dialog removes it and the profile order applies again.

### Several profiles match a user. Which one is used?

The active profile with the lowest Priority value. Archive a profile to stop using it without deleting it.
